Q: what is map according to programming

A: In programming, a **map** (also known as an associative array or dictionary) is a data structure that stores key-value pairs. It's like a container where you can store values with unique identifiers called keys. Here are the basic characteristics of a map: 1. **Key-Value Pairs**: A map consists of key-value pairs, where each key is associated with a specific value. 2. **Unique Keys**: Each key in a map must be unique, meaning no two keys can have the same value. 3. **Flexible Data Structure**:
